

Laboratory data Standard for eHealth Record in Hong Kong

LOINC Workshop 2013

John Mok
Health Informatician

Outline

- Background of eHR
- Planning of eHR for laboratory record
- Adopted laboratory record standards
- Proposed laboratory report models
- eHR Test Description for laboratory
- LOINC adoption strategy
- Q&A

Electronic Health Record

- An electronic **womb-to-tomb** health record comprising of all important health data about a person which can be accessed at anytime, anywhere by the authorized person.

Guiding Principles for eHR development

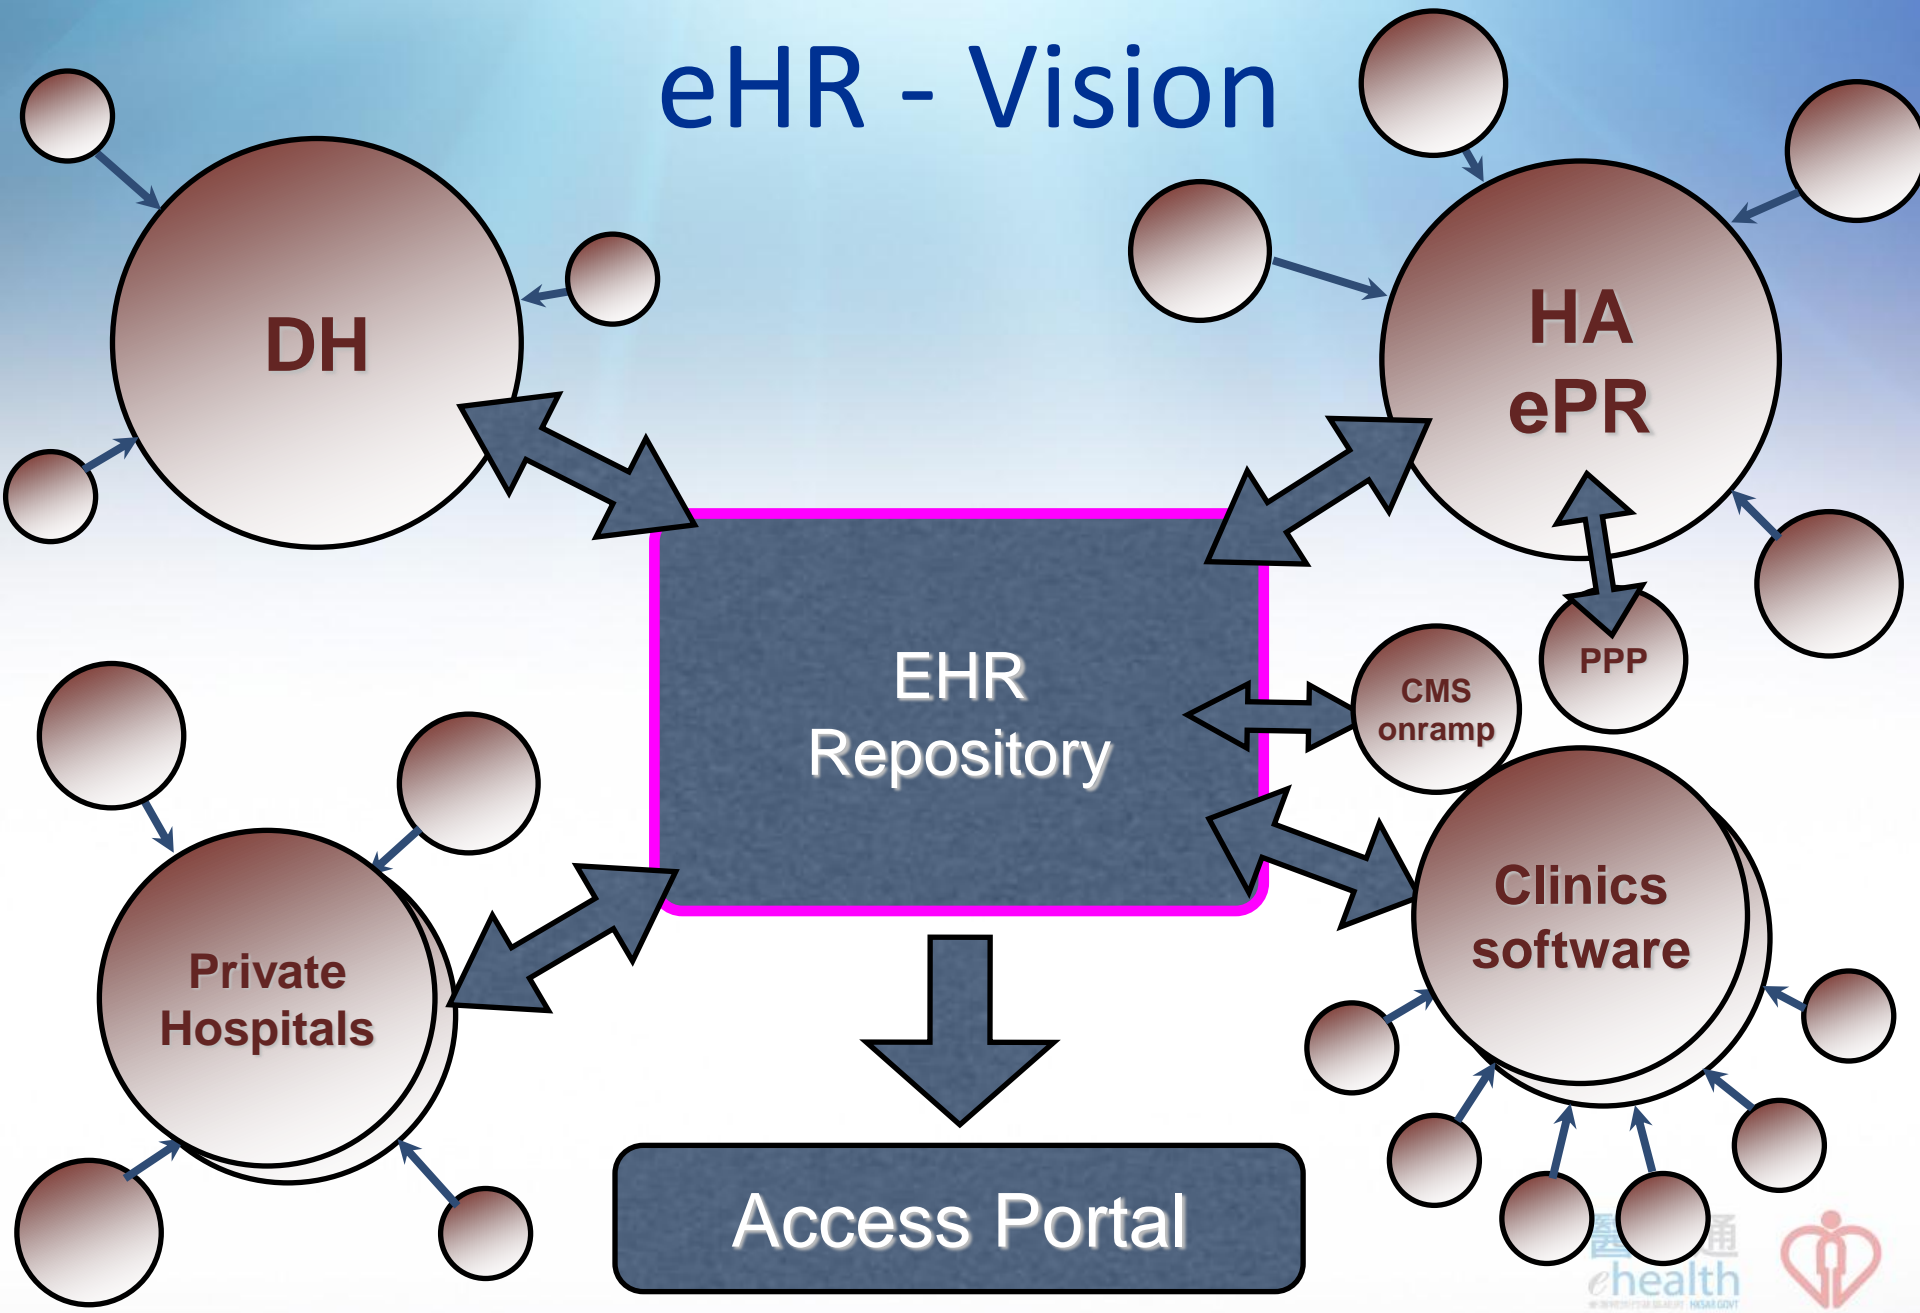

- Government led model
- Compelling but not compulsory record sharing
- Privacy and security of paramount importance
- Open technical standards
- Building block approach

Patient-oriented system

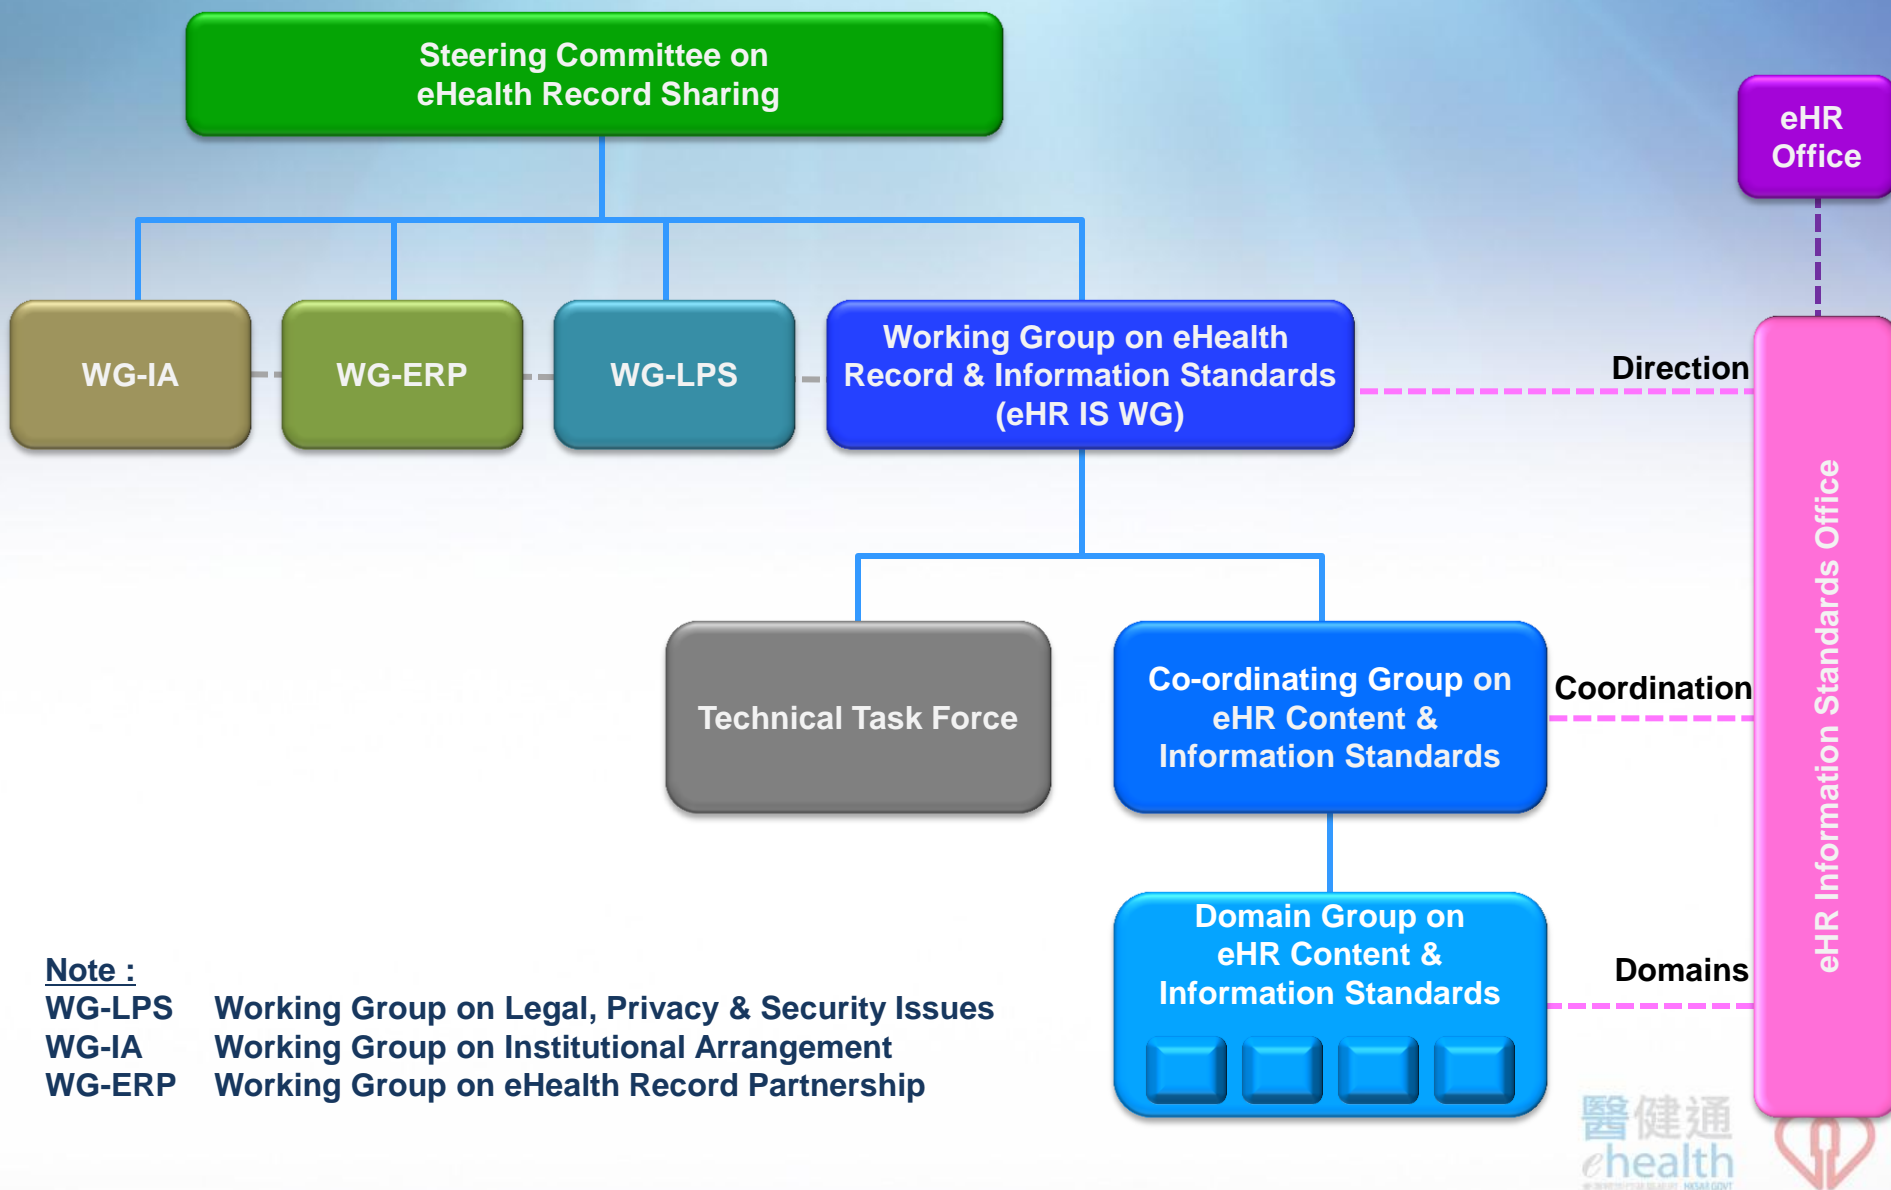

Standard-based records

Protocol-based operations

eHR - Vision

Organisation Structure for eHR Information Standards

eHR Information Standards

Domain Group on Laboratory Record

Three times
per year

Standardisation for eHR

- Ensure accurate interpretation of health data by all parties
- Support reuse of data
- Reduce duplicated efforts in data entry
- Facilitate interoperability of systems for data captured at different platforms
- Improve efficiency of healthcare services
- Assist in protection of public health

Phased Approach – A Proposal

Issues in Mapping LOINC Laboratory Tests to SNOMED CT

Olivier Bodnarider, MD, PhD
U.S. National Library of Medicine, NIH, Bethesda, MD
olivier@nlm.nih.gov

Abstract

Comprehensive clinical terminologies such as SNOMED CT and to overlap with specialized terminologies such as LOINC (e.g., for the domain of laboratory procedures). Terminological systems such as the ILMs are often used to bridge between terminologies. However, the integration of LOINC in the ILMs and with other terminologies remains incomplete. We mapped concepts for laboratory tests from LOINC to pre-coordinated SNOMED CT concepts, based on shared relations to other concepts. At LOINC is finer-grained than SNOMED CT, several LOINC codes tend to map to the same SNOMED CT concept. However, a large proportion of LOINC codes could not be mapped to SNOMED CT through this approach, because of underspecified definitions in SNOMED CT and a lack of fine-grained, pre-coordinated concepts in SNOMED CT.

Introduction

Biomedical terminologies and ontologies have proliferated in the past decade, not only for biology, but also for clinical medicine [1]. Terminologies such as SNOMED CT provide a large coverage of the domain of clinical medicine and often overlap with other large general terminologies (e.g., MeSH) and with specialized terminologies (e.g., LOINC).

In clinical information systems, terminologies such as SNOMED CT, used in patient records, need to be interoperable with terminologies used in subsystems, such as laboratory systems (e.g., LOINC). Terminology integration systems, such as the United Medical Language System (UMLS) play an important role in creating *a priori* link mappings between these terminologies and contribute to the interoperability of systems relying on these terminologies. A key element in identifying equivalent concepts across terminologies is the UMLS's *lexical* relationships among concepts names. As a consequence, concepts whose names are not mappable to natural language processing, such as the names of laboratory tests in LOINC, generally cannot be mapped to equivalent concepts in other terminologies. However, both SNOMED CT and LOINC provide formal definitions

for their concepts in the form of a rich set of relations to other concepts. Comparing such sets of relations also provides the basis for comparing these concepts, provided there are enough shared relations between the two terminologies.

The objective of this paper is to analyze the issues in mapping concepts for laboratory tests from LOINC to existing pre-coordinated SNOMED CT concepts, based on their definitions (i.e., their relations to other concepts) and to evaluate the properties of such mappings that can be derived automatically. Although SNOMED CT supports post-coordinates, this study is purposely limited to the mapping between pre-coordinated concepts in LOINC and SNOMED CT.

The development of these terminologies is often supported by public funding and harmonization between these terminologies has recently become a requirement from some funding agencies. Therefore, this study can also be considered a contribution to harmonizing SNOMED CT, the most comprehensive clinical terminology, with LOINC, the leading terminology for laboratory tests. While a few studies have explored the mappings of LOINC and SNOMED [2, 3], the two terminologies have not been harmonized yet.

Background

The general problem area of this study is ontology matching, i.e., the identification of equivalent (or related) concepts across ontologies. Among the approaches developed for aligning ontologies, the two major families of techniques exploit the lexical resemblance among concept names (lexical alignment) and the structural resemblance among sets of relations in which the concepts are involved (structural resemblance). A review of these methods is beyond the scope of this paper and the interested reader is referred to [4] for further information.

In the case of LOINC, as mentioned earlier, the names of laboratory tests are not amenable to natural language processing techniques, including edit distance, stemming and normalization, because LOINC concepts are created by concatenating with colors the names of the concepts to which a laboratory test is

SAFER • HEALTHIER • PEOPLE™

Terminology - A brief introduction of LOINC

LOINC - Background

- Logical Observation Identifiers Names and Codes
- LOINC system was initiated in 1994 by the Regenstrief Institute, a non-profit medical research organization associated with Indiana University.
- Developed for data exchange of lab results among different institutions

Why LOINC

- Most widely adopted reference terminology for Laboratory
- Nearly 60,000 terms and where 44,000 related to laboratory *(in 2011 figures)*
- Free to use
- Frequent update

An example of a LOINC code

SNOMED CT Introduction

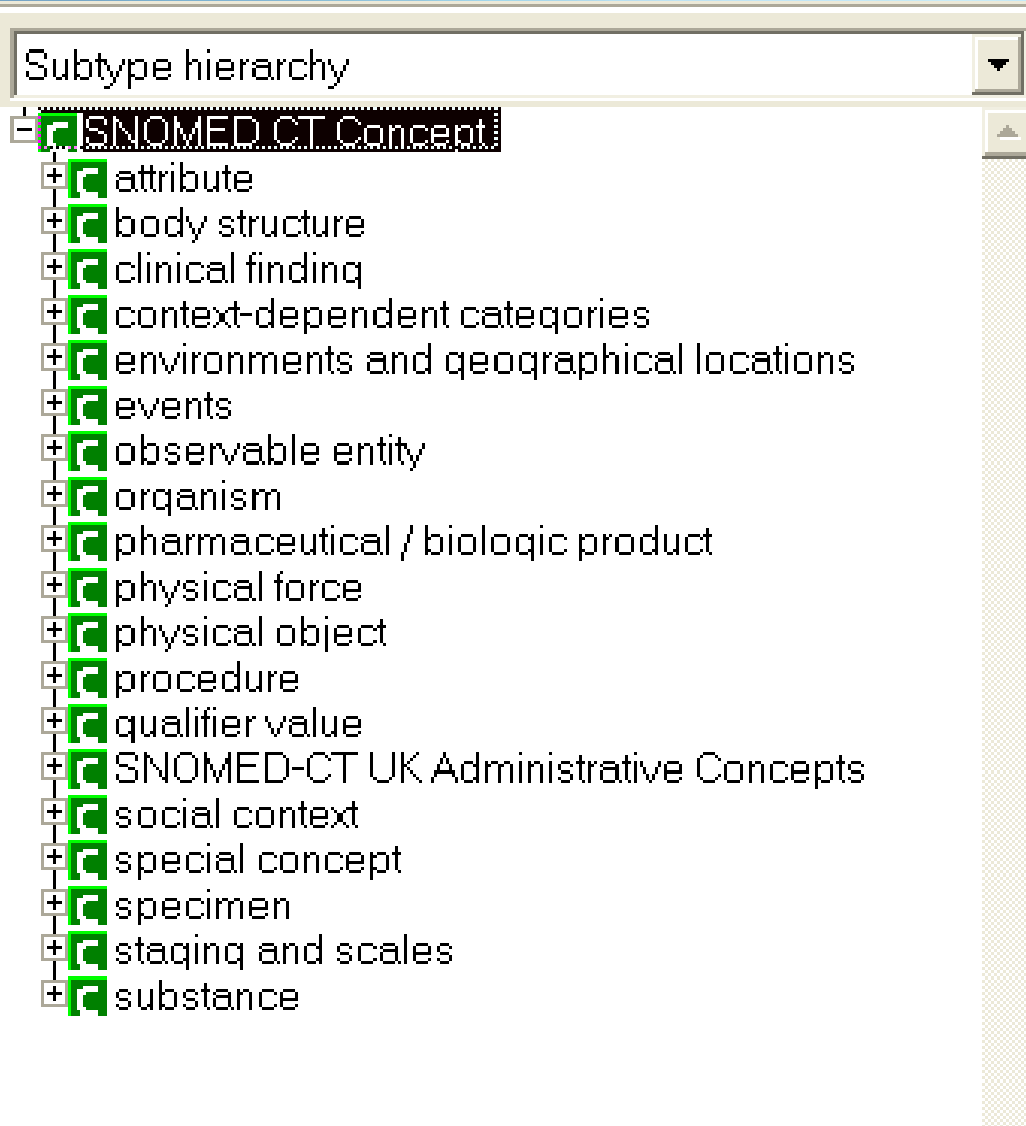

■ INTERNATIONAL HEALTH TERMINOLOGY
STANDARDS DEVELOPMENT ORGANISATION

What is SNOMED CT

- SNOMED CT is a comprehensive clinical terminology, originally created by the College of American Pathologists (CAP), collaborated with NHS, and is now licensed by the [International Health Terminology Standards Development Organisation](#) (IHTSDO).
- The terminology is comprised of **concepts, terms and relationships** across different scopes of health care.
- “**Concept**” is a clinical meaning identified by an unique permanent numeric identifier (Concept ID).
- Each concept has one unique “**Fully Specified Name**” intended to provide an unambiguous way to name a concept.
- Each concept in SNOMED CT is logically defined through its “**relationships**” to other concepts.

SNOMED CT

- Most widely adopted medical reference terminology
- Cover 19 domain area (hierarchies)
- Around 380,000 concepts
- Nearly 900,000 relationships

Find “MRSA” via a SCT browser

The screenshot displays the CliniClue Browser interface for SNOMED CT. At the top, the 'Concept Id' is 115329001 and the 'DescriptionId' is 176116017. The search term 'MRSA' is entered in the search bar, and the results are filtered by 'Words - any order' with a count of 9.

The search results are organized into three main sections:

- Clinical finding**
 - MRSA infection
 - MRSA - Multiple-resistant Staphylococcus aureus infection
- Procedure**
 - MRSA - Multi-resistant staphylococcus aureus screening
- Organism**
 - MRSA
 - CA MRSA
 - HA MRSA

The 'Hierarchy' section shows the 'Subtype hierarchy' for 'Staphylococcus aureus', which includes 'resistant bacteria' and 'methicillin resistant Staphylococcus aureus' (with subtypes 'Community associated methicillin resistant Staphylococcus aureus' and 'Hospital associated methicillin resistant Staphylococcus aureus').

The 'Concept Status' is 'current'. The 'Descriptions' section shows the 'Lang: en-US' descriptions: 'methicillin resistant Staphylococcus aureus (organism)', 'methicillin resistant Staphylococcus aureus', and 'MRSA'. The 'Definition: Primitive' section shows the 'is a' relationships: 'Staphylococcus aureus' and 'resistant bacteria'. The 'Codes' section shows the 'Original SNOMED Id : L-24852' and the 'Read Code (Ctv3Id) : XU3mN'.

微生物化驗報告 Microbiology Report

Case No.: SUR 07012345 (MSK: 223345)
Name: CHAN, TAI MAN 陳太文
HKID: A123456(1)
Sex: M Age: 10Y DOB: 01/07/1987
Ward/Spec/Ward/Bed: TOM/STB/AS/02
Doctor Request: Dr. Chan Wing
Dr. Ref.:
Lab No.: 0780377793
Date Collected: 13/03/07
Date Arrived: 13/03/07
Clinical Details: ? Fever
Specimen: Sputum

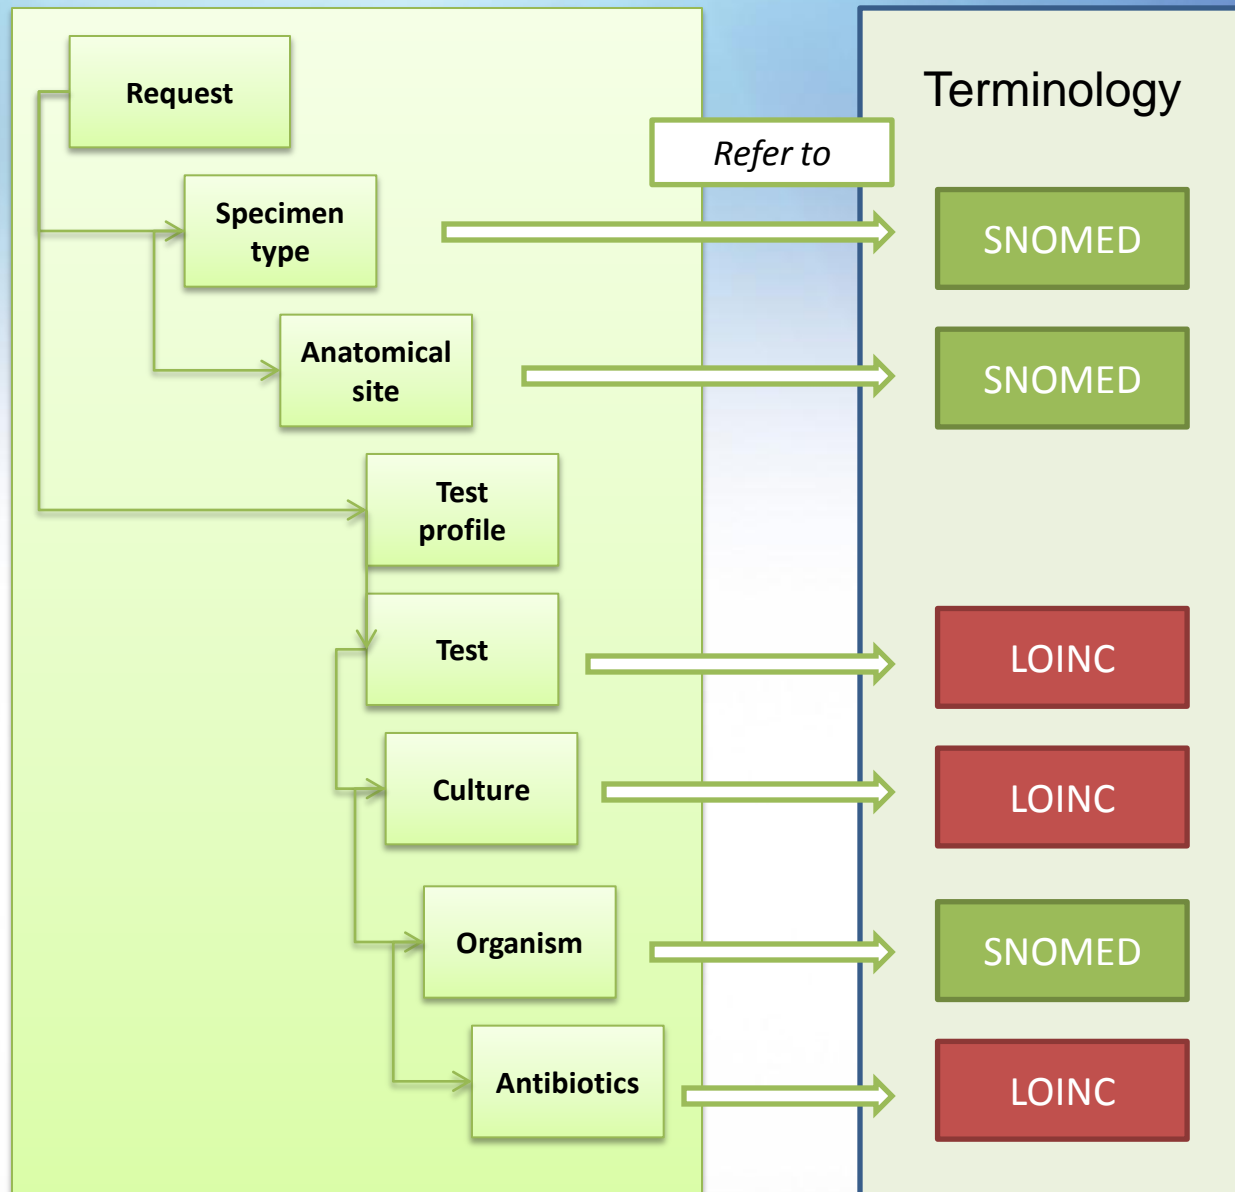

Final Report URGENT

Appearance: Purulent
Gram stain :-
WBC: ++ (Moderate)
Epithelial cell: ++ (Moderate)
Culture :-
Organism 1 : Methicillin Resistant Staphylococcus aureus (Heavy)

S

Lab No.: 07S0377791 Final Report URGENT
Data Collected: 13/03/07
Date Arrived: 13/03/07
Specimen: Endometrium

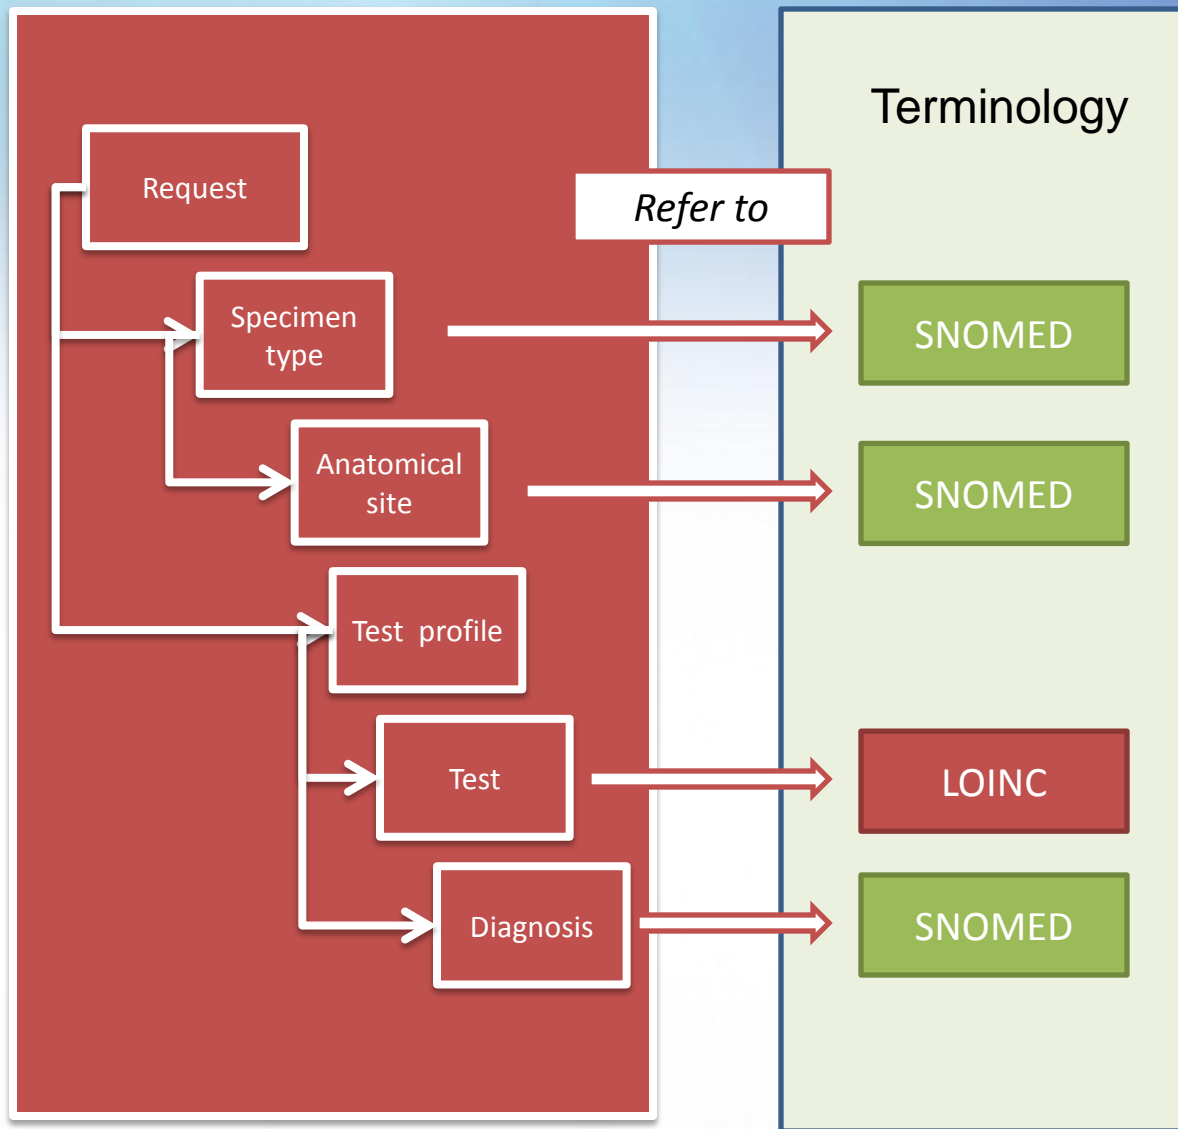

Clinical History
Irregular menses

Gross Examination
2 ml brownish soft tissue fragments. All embedded in 1 block.

Microscopic Examination
Section show secretory endometrial glands with supranuclear vacuoles and glandular dilatation in an edematous stroma. This is no endometritis, hyperplasia or malignancy.

Diagnosis
Endometrium, sampling - Secretory endometrium, PCD 7 - 8

Reported by: LIS Testing
Authorized by: LIS Testing

Printed on 13/03/2007 18:12
Page No.: 1/1

MICROSCOPIC EXAMINATION:

(A)

- Histological type: Adenocarcinoma (with extensive ulceration)
- Differentiation: Moderate
- Local invasion: pT3c - 5-15 mm beyond border of muscularis propria (block A7)
- Invasive pattern: Infiltrative
- Associated lymphocytic reaction: Patchy
- Peritumoural lymphovascular permeation: Absent
- Perineural invasion: Absent
- Extramural venous invasion: Absent
- Adjacent non-neoplastic colon: Unremarkable
- Serosal (peritonealised) surface: Clear (5 mm from tumour front)
- Proximal 'cut end' resection margin: Clear
- Distal 'cut end' resection margin: Clear
- Apical lymph node(s)
 - Number of lymph node(s) examined: 1
 - Number of lymph node(s) involved: 0
- All lymph node(s) (apical, intermediate and peritoneal)
 - Total number of lymph node(s) examined: 15
 - Total number of lymph node(s) involved: 0
- Dukes' stage: B (tumour beyond muscularis propria, nodes negative)

(B) Sections show full thickness large intestinal tissue, in which there is no evidence of dysplasia or malignancy.

DIAGNOSIS:

(A) Sigmoid COLON, anterior resection:

- Moderately differentiated ADENOCARCINOMA, pT3cN0 (TNM, AJCC 5th edition), Resection margins clear.

(B) COLON, distal resection margin, anterior resection - NO MALIGNANCY.

Final Report

Final Report(11/11/1996)

Gross Examination :

Submitted was a gall bladder measuring 7.5 cm long and 2 cm from its maximum diameter. The serosa was unremarkable. The gall bladder wall was slightly thickened. The mucosa showed multiple yellowish dots. 1 block.

Microscopic Examination :

Section shows gall bladder wall mucosa and cystic duct wall mucosa. There is mild degree of inflammation of the mucosa. Collection of foamy histiocytes are found in mucosal folds. The muscle coat is thickened.

Diagnosis :

GALL BLADDER cholecystectomy - CHRONIC CHOLECYSTITIS

Anatomical Pathology Report Content

- Compliance level 1, 2 and 3
 - Level 1 – report PDF
 - Level 2 – structured data (SNOMED 3)
 - Level 3 – structured data (SNOMED CT)
- Structured pathological report data
 - Gross/Macroscopic Examination, Microscopic Examination and Diagnosis, and any other narrative text for pathology report
- Diagnosis field
 - For level 2, structured data are always in pair
 - Topography – Morphology/Procedure/Disorder
 - For level 3, structured data are coded in SNOMED CT

Encoded Diagnosis

- Currently the encoded data in HA are in SNOMED 3
- T and M codes are always in a pair, and it can be more than 1 pair
- Will capture local code and local description
- No validation check on those local codes as they are level 2 compliance

Editorial Guide for Laboratory

Editorial Guide on Hong Kong Clinical Terminology Table - Laboratory

[Document Reference No. S01]

Version 1.0

The Government of the Hong Kong Special Administrative Region

Editorial guidelines – Test Display name

General principles:

- Test naming should be Clear, Precise and Concise.
- Tests are named according to the test, condition or disease rather than particular methodology.

Achieve “standard” test display names for eHR

LOINC Common Name

- Use LOINC Common Name as a base to construct our test display name for eHR
- Advantages- They are Distinct, Clear and Consistent
- For example:
 - Alpha-1-Fetoprotein [Moles/volume] in Serum or Plasma

Remove the Property

Replace “in” with “,”

Alpha-1-Fetoprotein, Serum

A proposed
test display name
for eHR

Test Display Name for eHR

- eHR IS Lab DG suggestions:
 - Map methodless LOINC code
 - Use LOINC Common Name as a base
 - May make reference to test display name in HA-ePR
 - Favor UK but US spelling also acceptable
 - Seek Lab DG members or (Editorial board) approval on the eHR test display name list

Editorial Guidelines – Test name

- The test name format and the order of the components are as follows:
 - `<analyte>_[(<abbreviation>)],_[<system>],_[<qualifier>],_[<method>]`
 - *Note:*
 - Component in square brackets is optional
 - An underscore indicates a space.
 - A comma is used in between components to separate them.
 - Capitalize first character of the every component after comma.
 - `<system>` can be optional if the specimen type information is indicated in another part of the record
 - e.g. Alpha-1-Fetoprotein, Serum
 - e.g. Follicle Stimulating Hormone, Serum
- ...

Standardized eHR Test Description

Organism

With Lab DG members advice:

- The organism name format and the order of the components are listed as follows:
 - <genus>_<species>_[<life cycle>],[<descriptor>]
 - *Note:*
 - Component in square brackets is optional
 - An underscore indicates a space.
 - A comma is place before descriptor
 - e.g. Escherichia coli

Specimen type (Microbiology)

With Lab DG members advice:

- ***Format of Specimen type***

- *<specimen>[,_<descriptor>]*

For multiple sites

- *<1st specimen> [,_<1st descriptor>]_+_<2nd specimen> [,_<2nd descriptor>]_...*

- *Note:*

- Components in square bracket is optional
 - An underscore indicates a space.
 - A comma is place before descriptor
 - A plus sign is used as connector between specimens obtained from multiple sites.

- e.g. Dialysis fluid

- e.g. Peritoneal dialysis fluid, post-dialysis

- e.g. Vaginal + rectal swab

Laboratory data standardization

| Type | Area | Terminology / Ref. | Status |
|---|-----------|----------------------------------|------------------------------------|
| Micro-organisms | HA and DH | SNOMED CT | ~2700 concepts |
| Specimen type (Microbiology) | HA and DH | SNOMED CT | ~460 concepts |
| Antibiotics sensitivity tests | HA and DH | LOINC | ~2700* |
| Microbiology tests | HA and DH | LOINC | |
| Biochemistry tests (common) | HA and DH | LOINC | |
| Haematology tests (common) | HA and DH | LOINC | |
| Immunology tests (common) | HA and DH | LOINC | |
| Anatomical Pathology (T&M codes) | HA and DH | SNOMED CT | ~5600* |
| Molecular/Esoteric tests | HA and DH | LOINC | In progress |
| Test description for eHR | eHR | LOINC & eHR DG (Lab) | Draft for DG (Lab) members comment |
| Editorial policy for laboratory terminology | eHR | LOINC & SNOMED CT & eHR DG (Lab) | Draft for DG (Lab) members comment |

*Initial mapping completed. Refinements are required on complicated terms

LOINC Adoption Strategy

- Goals & Roles
- Discrete data elements for lab results
- Your LIS readiness for structured lab data
- LOINC training
- Mapping rules & validation
- Mapping target (80/20 rule)
- Implementation
- Maintenance
